It features realistic, 3D graphics, an easy-to-use interface and a couple of different game modes. Easy-to-use graphics and game modes DXRacer is a fast-paced racing game, where the player tries to avoid collisions by using speed boosts to maximize their speed. The objective is to get the highest number of points at the end of

the race, or at least as close as possible. At any point in the race, the player can choose to either race alone or race in a duo. The option to race against a rival is nice, but requires a dedicated opponent. If no opponent is racing with you, you can race against the time. You have to catch up as fast as possible to the best time of the cars that are currently racing. The simulation can be adjusted, and the possibility to select the brake system and the tire type are also available. All the cars are well-made and you can even buy new ones. Game modes The standard races are set up in a circle. The game starts with easy settings and as you

advance in the game, the difficulty increases and you need to deal with more and more opponents. The game keeps track of your race performance and provides you with feedback. DXRacer also offers its unique three game modes: Open stage - Several races can be played simultaneously. Target game - The car that you select in the main game menu will be used for all the other races. Time rush - The number of races that you need to complete is set in this mode. The longer you manage to complete the races, the more bonus points you will receive at the end. Imagining Voyager is a free space

Description: ESCAM is one of the world's leading suppliers of information and communication technology solutions. With the increasing attention paid to the security of data, the Internet and information technology in general, ESCAM started to think about a new direction. The company decided to develop a unique, high-performance image content analysis and fingerprinting software. ESCAM R3_Fingerprint is designed to scan documents, printed media and other images at very high speed, extract the relevant information, and in the case of

the fingerprint, can actually identify the user of the image content. ESCAM R3_Fingerprint uses the principle of capture and recognition methods to digitize the image, and consists of a hardware module (sensor) and a signal acquisition and analysis software module. The hardware module (a CCD sensor) takes on the role of capturing the image, and the signal acquisition and analysis module converts the captured image into electronic signals that are then processed by the software and analyzed. ESCAM R3_Fingerprint can collect data and store them in secure databases on the server. This

eliminates the possibility of storing the data locally and corrupting the data. ESCAM R3_Fingerprint can reliably identify papers, pictures, and other media containing sensitive information quickly and accurately. ESCAM R3_Fingerprint has the following features: ■ It can capture and identify the signatures of paper documents, pictures, and other images quickly and reliably. ■ It can be used to control office equipment, building access control, and alarm systems. ■ It can be installed in different locations, including airports, control rooms, and shipping docks. ■ It can process a large

amount of images, including paper documents, pictures, and other images of various types. ■ It can be deployed on a network. ■ ESCAM R
